SANIKA J P

ABOUT ME

I'm Sanika, a Computer Science graduate from T John Institute of Technology, Bengaluru, skilled in Python, SQL, and data analysis. I have experience in software development and machine learning projects, including tool life monitoring and cancer prediction systems. With internships at Loginware Softtec, TechCiti Technologies, and Comedcares, I've developed strong analytical and problem-solving abilities. I'm passionate about using data and technology to create efficient, impactful solutions.

Bengaluru

SKILLS

- Management
- Software Development
- Software Development Engineer
- SQL
- Pl / Sql Development
- Data Analysis
- HTML Matplotlib
- Seaborn
- Data analysis Analyst
- Data analysis
- Certified Course
- Numpy
- Pandas

Language

English	Kannada	Hindi
100%	100%	100%

EDUCATION

B.E. (Computers Science)	Class XII	Class X
T John Institute of Technology, Bangalore	2021	2019
7.8%	92%	94%

CERTIFICATION COURSE

- Python, RDBMS & Cloud Computing from IBM
- Python with Data Analytics

INTERNSHIPS

Loginware Softtec | September 2024 - December 2024

Developed a comprehensive tool life monitoring system to enhance machining efficiency and reduce downtime. Applied predictive analytics to assess cutting tool wear, improving product quality and operational sustainability.

TechCiti Technologies | October 2023 - November 2023

Created a lung cancer prediction model that assesses user health and lifestyle inputs to predict cancer risk, using machine learning with Scikit learn and a PyQt4GUI.

Comedcares | October 2022 - November 2022

Rapid prototyping an automated dustbin that uses proximity sensors integrated with Arduino boards to open the lid automatically.

PROJECTS

Machine tool life monitoring system
October 2024 - December 2024

Developed a comprehensive tool life monitoring system to enhance machining efficiency and reduce downtime. Applied predictive analytics to assess cutting tool wear, improving product quality and operational sustainability.

Car Detection using labelIMG
March 2024 - April 2024

Created a system to detect and count cars in images using Labeling for labeling and training a model. The project demonstrates how computer vision can automate object counting.

AUTOMATIC DUSTBIN
OCTOBER 2022 - OCTOBER 2022

Developed an automated dustbin that uses proximity sensors integrated with Arduino boards to open the lid automatically. When an object or hand approaches the dustbin, the sensors detect the proximity, triggering the lid to open without any physical contact.
This project enhances hygiene and convenience, making waste disposal more efficient.
